

Abstract

An electronic slot machine game is set forth which includes an on-screen bonus and one or more separate screen bonuses. A processor randomly selects to activate a coordinate of a game matrix having one or more pay lines. The coordinate remains activated until a bonus is triggered. When a triggering symbol is randomly assigned to an activated coordinate, an on-screen bonus is issued. When the bonus is issued, all activated coordinates are de-activated. The bonus is related to the amount wagered to play the game, the number of activated coordinates and assigned values or multipliers. Second screen bonuses are triggered by scattered symbols or symbols on enabled pay lines and include a game themed screen for the player to select from a plurality of hidden bonuses or issues a random bonus accompanied by an entertaining video segment.
